One decision we can defend.

346 words · seven image-only slides · target 180 seconds with pauses. Timings are rehearsal targets, not a measured performance.

SLIDE 01 / 0–20s

Packaging uses forty percent of plastics consumed in the EU. For Profi, progress starts with a purchasing decision: which pack reduces virgin plastic while protecting the product? PackProof brings the comparison, evidence and next action together. These examples are illustrative, not measured Profi data.

Look at the judges. Pause after the purchasing question.

SLIDE 02 / 20–48s

The lightest pack is the nine-gram pouch. But count virgin plastic, including the lid, and the ranking changes: seventeen grams in the current tray, nine in the pouch, four point six in the high-PCR tray. At one million eligible packs and full adoption, that is twelve point four tonnes of potential annual reduction. Functional equivalence still needs validation.

Point to 4.6 g. Pause before the annual scenario; say potential clearly.

SLIDE 03 / 48–72s

The working app runs locally. A specification becomes proposed facts with component scope and an exact source passage. A person accepts, corrects or rejects each proposal. Missing values stay unknown; conflicting values need resolution. That evidence follows the calculation into a supplier-ready brief. This image illustrates the process.

Explain the human review once. Do not pretend the image is live inference.

From evidence to action.

SLIDE 04 / 72–97s

Now the retail reality. A two-hundred-and-fifty-degree requirement exceeds this illustrative two-hundred-and-twenty-degree limit. PackProof flags the mismatch. Food-contact conditions, holding time, grease resistance, sealing, shelf life and line performance need their own evidence. A lower material number never substitutes for a qualified trial. Owners define measurable acceptance limits and stop criteria.

Slow down on the mismatch. This is the practical-retail credibility moment.

SLIDE 05 / 97–120s

Uncertainty can become a useful question. This bottle beats the baseline only above sixty percent recycled content, with other inputs fixed. At sixty percent, they tie. PackProof asks for the exact bottle SKU and minimum content, excluding the cap. That focuses the next supplier conversation.

Point to 60%. Give the supplier question time to land.

SLIDE 06 / 120–158s

We propose a six-week pilot: ten real specifications, three shortlisted changes and one qualified trial. Procurement, quality and operations own the decision. We measure review time, evidence completeness, costs and product loss. Trial checks include logistics, consumer handling and local recycling evidence. Our commercial hypothesis is a paid review pilot followed by team subscriptions. Scale across categories after repeat value is demonstrated.

Count ten, three, one deliberately. Identify proposed business model as a hypothesis.

SLIDE 07 / 158–180s

Today, the local workbench works; retail outcomes remain to be proven. We are asking for specification samples, eligible volumes and one supplier review. Start with one decision we can defend, then repeat it. PackProof: less virgin plastic. Evidence attached.

Look up from the screen. Deliver the ask, then stop speaking.

Be ready for the questions.

Answer directly. Show the relevant application screen only if invited.

Why software instead of a new packaging material?

The challenge explicitly accepts digital decision support. PackProof helps the retailer compare existing options, identify evidence gaps and specify a qualified trial. It does not claim to have invented or certified a new material.

Are the 12.4 tonnes real savings?

They are an illustrative scenario: (17 minus 4.6) grams times 1,000,000 eligible packs times 100% adoption, divided by 1,000,000 grams per tonne. Real impact needs measured masses, guaranteed content, actual volume and functional equivalence.

Does this solve the 250°C hot-food requirement?

The example detects a mismatch; it does not solve it. We need the exact package specification, actual contact profile, food type, holding time and lid restrictions, followed by qualified trials.

What if AI invents a number?

It proposes a field with a source passage and scope. The app checks schema and quotation presence, but semantic review remains human. No general accuracy claim follows from our small synthetic test. Manual entry and labelled replay remain available.

What about shelf life, recyclability and consumer experience?

The pilot includes product loss, protection, grease, logistics, consumer handling/disposal and local collection evidence. Recycled content does not establish recyclability. Owners must agree measurable limits and stop on unacceptable trade-offs.

Why would someone pay rather than use Excel?

Excel can do the arithmetic. Our commercial hypothesis is that a joined-up source review, use check and decision record saves review effort and missed assumptions. A paid scoped pilot tests that value before subscription pricing or broad rollout.

How does it scale?

Start with one decision and category, then repeat where value is measured. Team access, permissions, stronger audit storage and procurement integrations are roadmap work. The delivered application is local and single-user.

What should the judges see working?

Open the app: change a component value, inspect its evidence, show the hot-food mismatch, follow Continue review, and open the current-data supplier brief. The pitch itself remains image-only. Do not describe the generated illustrations as real supplier packages.

Source for the opening fact: European Commission packaging-waste page, checked 26 September 2026. All demonstration masses, costs and projected reductions are illustrative.
